

# New Command Product Unveiled

LINDON, Utah—June 12, 2008—Wavetronix has released a new product that offers advanced data analysis and reporting capabilities designed specifically for planning groups. DataView collects raw data from a variety of sources, including Command DataCollector and PRN files, and converts it to pre-defined formats for federal reporting and other planning activities. It also features filtering tools that can identify incomplete or erroneous data and flag it for analysis.

“DataView makes traffic data more visible to users and converts the data to the formats needed most by planning department,” says Brian Hagen, chief operating officer at Wavetronix.

DataView will be sold as part of the Command line of data management appliances beginning in September, 2008.
