

RuggedVue[™] - Network Management Software

A Cost Effective Tool to Manage and Visualize Your Network and Connected Devices'

RuggedVue[™] is a server based tool that provides an extremely powerful method for visualizing the performance and representing the true physical structure of any network. RuggedVue[™] also provides a means to visually organize web based content and allows users from various departments within an organization to easily navigate with graphical and easy to use network management tools.

RuggedVue[™] Discovers, Documents and Monitors all Devices on a Network

RuggedVue[™] dynamically discovers, using multiple TCP/IP mechanisms, all nodes that exist on a network. A database is created containing specific details from all managed switches and SNMP enabled devices. The web browser can then access the RuggedVue[™] server to view the exact physical network topology and manage or obtain status of all connected devices.

Key Features and Benefits

Graphic Visualization

- ▶ The exact network layout is represented with a hyperbolic tree structure for ease of use, overview and tracking on a single page.

Dynamic Discovery

- ▶ RuggedVue[™] and its inherent dynamic nature will discover and track all wireless, roaming or fixed devices in real time.

Real Time Monitoring

- ▶ All devices and their connection, including wireless, in the network are constantly monitored for their potential status.

Documenting System

- ▶ RuggedVue[™] allows linking to all types of documentation in different web accessible locations. Documents like electrical diagrams, product manuals, mechanical drawings, user and operational manuals are easily accessible.

Client Server Architecture

RuggedVue[™] supports two types of licenses:

- ▶ Server License – A server based software package that will deliver the network data to all browsers on the network. Allows multiple users with one license without any specialized client software.
- ▶ Single User License – A software package that allows one single user per license. Provides a cost effective solution for small networks.

Multiple User Views

RuggedVue™ allows users to configure personalized views. In addition to IP addresses and device name views, users can define by physical location, device function or any other definition they may choose.

Network Event Monitoring

RuggedVue™ provides a detailed log of all events happening on the entire network. This tracking provides a security, maintenance and network management aspect for the user in an easy format.

Network Connection Monitoring

RuggedVue™ monitors every connection in the entire network. The user definable thresholds and lost communications will change the colours of the connections in the network overview, visually and possibly alarming by E-mail.

Web-based Device Documentation

RuggedVue™ provides URL linking to files or Web pages either embedded in the devices or located on the external file servers, with all documents relative to each device such as; manuals, diagrams, drawings, pictures, video feeds, sound, training, etc...
